

Thelocephala pulchella selbstfertil?

Beitrag von „sourvibes“ vom 6. Juni 2022, 14:36

Hello Katja,

the genus Thelochepahla is in the Notocactaeae tribe with Parodia and others (see [Eriosyce](#)) .

I really doubt they are compatible with anything within the Trichocereae (Echinopsis/Rebutia/Gymnocalycium) or other tribes.

I suppose this can be the effect of external pollen disabling self incompatibility mechanism, and what is achieved is self fertilization.

Fabio
