

# **Thelocephala pulchella selbstfertil?**

**Beitrag von „Katja“ vom 6. Juni 2022, 16:08**

Hi Fabio,

thanks for the link. That's very interesting. If I'm interpreting this correctly then most of Eriogyne are self sterile, but considering the fact that they are located somewhere in Notocateae I guess if seeds are produced in the two fruits on my plant then they are most likely to be a result of induced/stimulated self-pollination (I don't know the correct English term for this).

kind regards  
Katja
