

Einordnung der Hybriden

Beitrag von „morgan“ vom 30. Juni 2022, 13:40

I would also classify 'Sunny' as LH.

all the old classification were based on phenotype (the esthetics, in a simple explanation) while the new classification is built on genotype (DNA research, biological base).

Maybe we could agree that we use phenotype and not genotype? And what the actual genetic composition is, is of secondary importance!? (at least this is my way of seeing taxonomy, that most of us who are into hybridisation discard the new classification where all are considered echinopsis, and that we still use the old way with Trichocereus, Chamaecereus, Soehrensia, Pseudolobivia...)

when I use 'Sunny' in my hybridisation, I think of it as LH (when choosing parents, thinking about compatibility and the looks of the coming offspring etc).

(I'm making a new effort to take part in discussions here, my last one was like 10 years ago and it wasn't totally accepted, so I've been a passive member since)

LG
