

# Echinopsis hybrids with Hildewintera as father?

**Beitrag von „hartikos“ vom 26. September 2012, 10:34**

Hello morgan,  
in various genres pollen size, -shape, fit with the inclusion of the stigma did not match. You can visualize it this following:

image 1

When trying to pollination this looks like this:

image 2

The pollen is not in the inclusion!

You can zoom through pollination stimulus recording. You use, for example, cement dust and takes it on the stigma. Thereby the inclusion is corrosive and will be larger. After about an hour you can then perform the actual pollination. Looks as follows:

image 3

There are certainly more ways this is one of them.  
I hope my English was good enough and I could help.  
Regards

Gerhard
