

Rippenpfropfung - Experiment zur Rettung einer "Winterleiche"

Beitrag von „Bravo-CLIA“ vom 20. Juli 2015, 13:31

Hello Bernhard

Why not you remove the new pad of the Optuntia?

You did many nice work. For me on Optuntia is so hard. I just graft one small arolen. it collected from a small offshoot. SO hard for me to let the arolen on the stock(Optuntia)

For me, just succeeded on Tr.escayachensis Echinopsis sp and Harrasia jusbertii.

Compare to my recently results, the Echinopsis is enough power, maybe 11days after The wool appear on the Arolen.

But I have to wait the spine, in my memory Tr just costed 16 days from a arolen to visible bud. Now that bud is 2cm in Diameter and 3cm in high. 😊
