

tissue culture

Beitrag von „Timm Willem“ vom 27. August 2017, 12:02

Tissue culture of cacti is a really difficult thing to run over a longer period. You may have success establishing the chosen variety into sterile conditions and start to propagate it but due to some subcultivation it will start producing more and more watery tissue(hyperhydricity). And that finished all my activities every time I tried growing cacti in tissue culture.

(With other succulent plants TC is much easier and the descriptions, medium and methods are much clearer)
