I think, Your problem is caused by normal glass, so the ultra violet light can pass through sunburn , causing.

Maybe Your problem may be caused by using the wrong fertilizer. If You use a nitro gene - based fertilizer , the cells become too week. . [/ quote]

Hello muddyliz,

Thank you for your input.

It is interesting to hear about your conditions.

Yes I am rapidly thinking it is the high levels of UV sunshine that is causing my problems through glass

I also think I may be weakening my plants with nitrogen for quick growth.

It is strange...normally in the tropics or very sunny conditions with most plants you increase fertiliser to keep pace with fast growth.

Your Equisetum manure is very interesting information.

Maybe also the high evels of sunshine and water splashes, or misting are causing my problems.

With regards

LeeAlan
